

Online Demo: <http://payotbn.github.io>

There is a problem with our website when we surf via mobile phone. In this case I've tested with iPhone. You can see the screenshot in below.

As you can see in below screen shot, text are mixed together and is not cleared.

To fix this problem we need to use media query in CSS. Please see below example:

```
@media (max-width: 640px) {  
  /****  
  do something  
  ****/  
}
```

This query execute a code when a visitor surf our website with mobile or actually smaller device screen. For instance we can change font size with below code

```
@media (min-width: 640px) {  
  .sample {  
    font-size: 8px;  
  }  
}
```
